Antimicrobial activity and Essential oil Compositions of Two Ranunculus Species from Turkey: R. constantinopolitanus and R. arvensis

Antimicrobial Activity and Essential oil Compositions of Two Ranunculus Species from Turkey: R. constantinopolitanus and R. arvensis

Salih Terzioglu[†], Ahmet Yasar, Nuran Yayli, Nagihan Yilmaz, Sengul Karaoglu[‡] and Nurettin Yayli* Department of Chemistry, Faculty of Arts and Sciences Karadeniz Technical University, 61080 Trabzon, Turkey Fax: (90)(462) 3253196; Tel: (90)(462); E-mail: yayli@ku.edu.tr

The isolated essential oils of *Ranunculus constantinopolitanus* and *Ranunculus arvensis* were tested for antimicrobial activity against the bacteria *E. coli, K. pneumoniae, P. aeruginosa, E. faecalis, S. aureus, B. cereus* and the fungus *C. albicans.* They showed moderate antimicrobial activity against *P. aeruginosa, E. faecalis, S. aureus* and *C. albicans.* The composition of essential oils obtained from the air-dried *R. constantinopolitanus* and *R. arvensis* were also analyzed by GC-MS. 45 and 36 Components were identified in the essential oils and the main component of these taxa was (Z)-phytol in the ratio 23.6 and 19.5 % from *R. constantinopolitanus* and *R. arvensis*, respectively.

Key Words: *R. constantinopolitanus, R. arvensis*, Ranunculaceae, Antimicrobial activity, Essential oil, GC-MS.

INTRODUCTION

Ranunculus L. (Ranunculaceae) represented with 94 native taxa of which 82 are in species level in Turkey. They are annual or perennial herbs and 19 of the taxa are endemic to Turkey¹⁻⁴. All parts of the plant are poisonous when it is fresh. The toxins are destroyed by heat or by drying and the plant also have a strongly acrid juice that can cause blistering to the skin^{5,6}. R. factorial L. and R. scabrous L. have been used pain killer and cure of hemorrhoids and R. acre L., R. asioticus L. and R. sceleratus L. were used in folk medicine to treat blain⁷. R. constantinopolitanus (DC.) Urv., is a perennial herb and very common in Turkey and it grows moist places especially in marshy meadows¹. R. arvensis L. is mainly distributed in Mediterranean and Irano-Turanian region of Turkey. It is an annual herb and often grows in segetal habitats, often in cornfields¹.

^{\$}Department of Biology, Faculty of Arts and Sciences, Rize University, 53100 Rize, Turkey.

To our best knowledge, no previous work has been reported on the essential oil analysis and antimicrobial activity of *R. constantinopolitanus* and *R. arvensis*. But, antimicobacterial activity of *R. constantinopolitanus* is mentioned in the literature⁸. Thus, the systematic research was carried out by the extraction of the essential oil constituents of the plants by hydrodistillation in a Clevenger-type apparatus. The obtained essential oils were then investigated by GC-MS technique. Identification of the compounds was made by a typical library search and literature comparison⁹⁻¹⁶.

EXPERIMENTAL

R. constantinopolitanus and *R. arvensis* were collected in Trabzon, Turkey (A7) in May 2005, Voucher specimens (No. Coskunçelebi 632-2005 and 633-2005, KTUB) were deposited in the Herbarium of the Department of Biology, Karadeniz Technical University, Turkey. The species were identified immediately after collection^{1,2} and air-dried at room temperature for later analysis.

Isolation of the essential oils: 60 g of air-dried plant material from each taxon were blender into small pieces and the essential oils were obtained by steam distillation in 500 mL distilled H₂O for 3.5 h in a Clevenger-type apparatus with ice-water cooling bath system (4 h) (yields: 0.18 and 0.25 % (v/w), respectively). The oils were taken by HPLC grade *n*-hexane (0.5 mL) and dried over Na₂SO₄ kept at 4 °C in a sealed brown vial. One mL of the extracts was directly injected into the GC-MS instrument.

Identification of components: The components of the oil were identified by their retention times, retention indices relative to C_6 - C_{32} n-alkanes by comparison of their mass spectra with those of mass spectral libraries (NIST and Willey) with data published in the literature⁹⁻¹⁶.

GC-MS Analysis: GC-MS analyses were as described previously¹³.

Antimicrobial activity assessment: All test microorganisms were obtained from the Refik Saydam Hifzissihha Institute (Ankara, Turkey) and are as follows: *Escherichia coli* ATCC 25922, *Klebsiella pneumoniae* ATCC 13883, *Pseudomonas auroginosa* ATCC 10145, *Enterococcus faecalis* ATCC 29212, *Staphylococcus aureus* ATCC 25923, *Bacillus cereus* 709 ROMA, *Candida albicans* ATCC 10231.

Agar well diffusion method: The agar well diffusion method was adopted ^{17,18}. Overnight cultures of microorganisms were adjusted to *ca*. 106 cfu/mL according to McFarland turbidity standards and spread over the appropriate media (Mueller-Hinton agar (Difco, Detroit, MI) for bacteria, Sabouraud Dextrose agar (Difco, Detroit, MI) for yeast) in petri dishes. Wells of 5 mm diameter were punched into the agar medium and filled

with 100 μ L of essential oil solutions. The plates were incubated at 37 °C for 18-48 h and the inhibition zones around the wells were measured (data not shown). The antimicrobial effects of solutions that produce 6 mm zones of inhibition were tested quantitatively in respective broth media by using double dilution and the minimal inhibition concentration (MIC) values (μ g/ mL) were determined.

The antibacterial and antifungal assays were performed in Mueller-Hinton broth at pH 7.3 and buffered Yeast Nitrogen Base (Difco, Detroit, MI) at pH 7.0, respectively, in 96 well-plates according to National Committee for Clinical Laboratory method. The MIC was defined as the lowest concentration that showed no growth. Ampicillin and fluconazole were used as standard antibacterial and antifungal drugs, respectively. The samples were dissolved in chloroform to prepare sample stock solution. Chloroform with dilution of 1:10 was used as solvent control. The results are shown in Table-1.

TABLE-1 SCREENING RESULTS FOR ANTIMICROBIAL ACTIVITY OF THE ESSENTIAL OILS FROM R. constantinopolitanus AND R. arvensis

Sample	Stock solution	Microorganisms and MIC ^a values (μg/mL)						
Sample	(μg/mL)	Ec	Kp	Pa	Ef	Sa	Вс	Ca
R. constantinopolitanus	400	_	_	_	10	10	_	20
R. arvensis	300	_	_	8	8	8	_	34
Ampicillin		8	32	>128	2	2	2	
Fluconazole								8

 ^{a}MIC = The lowest concentration causing total inhibition of microbial growth in $\mu g/mL$.

Ec = Escherichia coli ATCC 25922, Kp = Klebsiella pneumoniae ATCC 13883, Pa = Pseudomonas aeruginosa ATCC 10145, Ef = Enterococcus faecalis ATCC 29212, Sa = Staphylococcus aureus ATCC 25923, Bc = Bacillus cereus 702 Roma, Ca = Candida albicans ATCC 10231; (-): no activity at stock solution concentration (100 µL).

RESULTS AND DISCUSSION

The antimicrobial activities for the essential oils of *R. constantinopolitanus* and *R. arvensis* were tested in vitro using the agar-well diffusion method with the microorganisms^{17,18} as seen in Table-1. The essential oils showed antibacterial activity against three bacteria and against the yeast-like fungus tested. The test extracts showed better antimicrobial activity against Grampositive bacteria in comparison to the Gram-negative bacteria. The essential oil extracts of *R. constantinopolitanus* showed antimicrobial activity against

Enterococcus faecalis ATCC 29212, Staphylococcus aureus ATCC 25923 and Candida albicans ATCC 10231. The essential oil of R. arvensis were effective against Pseudomonas aeruginosa ATCC 10145, Enterococcus faecalis ATCC 29212, Staphylococcus aureus ATCC 25923 and Candida albicans ATCC 10231. But no antimicrobial activity was observed against the bacteria Escherichia coli ATCC 25922, Klebsiella pneumoniae ATCC 13883, Pseudomonas aeruginosa ATCC 10145, Bacillus cereus 702 Roma for R. constantinopolitanus and Escherichia coli ATCC 25922, Klebsiella pneumoniae ATCC 13883 and Bacillus cereus 702 Roma for R. arvensis.

The essential oil compositions of *R. constantinopolitanus* and *R. arvensis* were analyzed by GC-MS with HP-5 column. A total of 45 and 36 components were identified on the basis of a typical library search and literature data with selecting only the components showing matches exceeding 81 %, which represented about 97.3 and 93.6 % of total composition of the essential oils in *R. constantinopolitanus* and *R. arvensis*, respectively⁹⁻¹⁶. The general chemical profile of the essential oils, the percentage content and the calculated retention indices of the constituents are summarized in Table-2.

Total			98.6	96.5

RI = Retention index; LRI = Literature retention index; Q = Quality; A = Ranunculus constantinopolitanus; B = Ranunculus arvensis.

"Compounds are listed in order of elution. RI (retention index) values are calculated from retention times relative to that of n-alkanes (C_6 - C_{32}) on the non-polar HP-5 column.

(Z)-Phytol (23.6 %), methyl linoleate (8.7 %), carvacrol methyl ether (7.2 %), n-pentacosane (4.8 %) and 6,10,14-trimethyl-2-pentadecanone (4.7 %) were the main constituents of the essential oil of R. constantinopolitanus, whereas (Z)-phytol (19.5 %), 6,10,14-trimethyl-2-pentadecanone (8.5 %), globulol (7.4 %), aromadendrene (5.9 %) and methyl linoleate (5.4 %) were the main components of the essential oil of R. arvensis. The chemical class distribution of the essential oils of R. constantinopolitanus and R. arvensis are reported in Table-3. The compounds were separated into six classes, which were monoterpene, monoterpenoids, sesquiterpenes, sesquiterpenoids, diterpenoids and others (Table-3). Twenty compounds were common to all two species with the similar total ratio of 67.5 and 67.1 % in R. constantinopolitanus and R. arvensis, respectively. Some chemical differences on the composition of the essential oils of R. constantinopolitanus and R. arvensis were found and probably related to the different subspecies and/or to the geographical origin of the plants.

TABLE-3
CHEMICAL CLASS DISTRIBUTION OF THE ESSENTIAL OIL
COMPONENTS OF R. constantinopolitanus AND R. arvensis

	R. consta	antinopolitanus	R. arvensis		
Compound class	Area (%)	Number of compounds	Area (%)	Number of compounds	
Monoterpene	0.4	1	-	-	
Monoterpenoids	18.3	9	5.5	2	
Sesquiterpenes	12.8	9	26.2	12	
Sesquiterpenoids	8.5	4	22.5	7	
Diterpenoids	24.8	3	21.1	3	
Others	32.5	19	18.3	12	
Common compounds	67.5	20	67.1	20	

ACKNOWLEDGEMENT
